

Enjoy the Holidays!

Then Recycle Your Christmas Tree

Real Christmas Trees are renewable. While they are growing, Real Christmas Trees absorb carbon dioxide and other gasses, emitting fresh oxygen in the respiration process.

Real Christmas Trees are grown on farms just like any other crop. To ensure a constant supply, Growers plant on to three new seedlings for every tree they harvest.

On the other hand, artificial trees are a petroleum-based product. The average family uses and artificial tree on the average of seven years before throwing it away, where it will remain in a landfill for centuries after disposal.

**Put your Real Christmas Trees out for collection
Wednesday, January 5 or Friday, January 7.
